

Project Design Phase
Proposed Solution Template

Date	02 October 2026
Team ID	SWTID-2026-9223
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	The current IT procurement process for standard laptop orders involves manual handling after a request is submitted and approved. The configuration task may not be created or assigned to the Hardware team immediately, which can cause delays, additional manual effort, and longer waiting time for users. The project solves this problem by automating the creation and assignment of the laptop configuration task after approval.
2.	Idea / Solution description	Implement a ServiceNow Flow Designer workflow for the Standard Laptop Service Catalog item. When the Standard Laptop request is approved, the flow automatically creates a Catalog Task using the Requested Item record. The task is populated with the short description and description 'Laptop need to Configured', the Approval value is set to 'Approved', and the Assignment Group is set to 'Hardware'. This removes the need for a procurement team member to manually create and assign the configuration task.
3.	Novelty / Uniqueness	The solution uses ServiceNow Flow Designer to automate the transition from an approved laptop request to a Hardware configuration task. Instead of relying on manual task creation and assignment, the workflow performs these actions consistently after approval. This provides a repeatable and controlled process specifically for standard laptop procurement.
4.	Social Impact / Customer Satisfaction	The solution reduces avoidable waiting time for employees who request standard laptops because the Hardware team receives the configuration task automatically after approval. It also improves task visibility and coordination for the Hardware team and reduces repetitive administrative work for the IT procurement team. As a result, the laptop procurement and

		configuration process becomes more consistent and user-friendly.
5.	Business Model (Revenue Model)	This is an internal IT service-management automation project and does not directly generate revenue. Its business value is obtained through reduced manual effort, improved IT resource utilisation, faster task allocation, fewer process delays, and more efficient handling of standard laptop requests within the organisation's existing ServiceNow environment.
6.	Scalability of the Solution	The workflow can be extended to other standard IT hardware and service requests such as desktops, monitors, docking stations, keyboards, and other predefined equipment. Similar Flow Designer flows can use different assignment groups, task descriptions, and approval conditions for different catalog items. Therefore, the same automation approach can support a larger volume and wider range of IT procurement requests without proportionally increasing manual task-management effort.
